

USE: Reference list to purchase or stock approved metering service equipment

## APPROVED METERING AND SERVICE EQUIPMENT

### SUSPENSION OF APPROVED METER SELECTION

To support customers and suppliers in obtaining metering equipment during supply chain disruptions, the Company is temporarily suspending the requirement to purchase approved metering equipment on the SR-452, Pages 2-14.

A panel that is purchased for installation within the Company Service Territory must either be an approved panel as listed in SR-452 or match all panel requirements as shown on this page and within the 400 Section for the type of panel the customer will be installing. See SR-405 for additional details.

### Guidelines for Metering Equipment

0 to 400 amp single and three phase services for self-contained meter enclosures (meter sockets only, all in ones, multi-packs and pedestals):

- Classified as EUSERC, UL and ANSI approved metering equipment
- AIC rating of 10,000 amps or greater. See SR-510 for specific AIC rating requirements.
- "A" base or "K" base meter sockets are not approved (bar type / bolted in meters are not allowed)
- All sockets will be ring types (ringless sockets not allowed)
- Dual rated enclosure for Overhead and Underground usage are required, except as noted
- All non-residential services shall have manual means of bypassing (not applicable for non-occupied services) so businesses will not be affected when maintenance is performed.
- Manual link bypasses (lever bypasses and automatic bypasses not allowed)
- Safety Sockets will be utilized on any 480 volt services
- Breakers used as main disconnecting devices rather than fuses when fault interrupting capabilities are in compliance.
- Fused equipment approved on a case by case basis for retrofits or where a main breaker disconnects fault interrupting ratings would be exceeded. Pull Out fused disconnects are not allowed.
- Multi-pack equipment with more than 4 sockets in height will not be accepted.
- 400 amp self-contained meter socket with manual link bypasses are for single phase only.
- Grounding must be made on the load-side of the metering equipment, not within the utility section. See Section 600 for details.
- Neutral terminal must be bonded to the enclosure. For details, see appropriate SR within Section 400 for type of service being installed.
- Panel shall be complete and will not be accepted with missing hardware. All hardware to be tightened to manufacturer's specifications.
- Equipment shall meet all requirements per SR-405.
- All equipment must be lockable and sealable.

This list of approved manufacturer's meter sockets is indicative of many types of equipment that are acceptable but is not an exhaustive list of all possible acceptable versions manufactured by a particular company. See the guidelines for selecting meter equipment. Customer's are encouraged to have Design Services review the panel specifications before purchase to ensure that the equipment meets all requirements. This will prevent the customer from having to replace the equipment after installation if it is found to be deficient for the required application and ensures a timely energization.
